# DM7474
# Dual Positive-Edge-Triggered D Flip-Flops with Preset, Clear and Complementary Outputs

## General Description

This device contains two independent positive-edge-triggered D flip-flops with complementary outputs. The information on the D input is accepted by the flip-flops on the positive going edge of the clock pulse. The triggering occurs at a voltage level and is not directly related to the transition time of the rising edge of the clock. The data on the D input may be changed while the clock is low or high without affecting the outputs as long as the data setup and hold times are not violated. A low logic level on the preset or clear inputs will set or reset the outputs regardless of the logic levels of the other inputs.

## Features

- Alternate Military/Aerospace device (5474) is available. Contact a Fairchild Semiconductor Sales Office/Distributor for specifications.

H = High Logic Level
X = Either Low or High Logic Level
L = Low Logic Level

**Note 2:** *The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.*

**Note 3:** The symbol (↑) indicates the rising edge of the clock pulse is used for reference.

**Note 4:** $T_A$ = 25˚C and $V_{CC}$ = 5V.
